

# Scorpius — Team Brief

Build with AI: EdTech Hackathon · 23–24 May 2026 · New Uzbekistan University

Read this once before the hackathon. It tells you what we're building, what you personally do, and how the two days run. Most of us haven't done a hackathon before — that's fine. This is the map.

## 1. What we're building — Scorpius

**Scorpius** is an AI tutor that turns **emaktab.uz** from a passive gradebook into a personalized tutor. It reads a student's real grades, finds the exact lesson in the Uzbek curriculum, and teaches it one swipeable card at a time — then briefs the parent. Our track is **General Education** (schools, learners, parents, teachers).

**Why it can win:** it's built on real emaktab data nobody else has, and a genuine adaptive learning engine — not a thin chatbot. The judges explicitly reward AI that "supports the core value," not a chatbot layer.

## 2. The hackathon — the hard facts

- Two-day build, **23–24 May**, New Uzbekistan University. Venue closes **19:00** each day (remote work allowed after, no official support).
- Platform: **ai.gdgtashkent.uz** — team registration, dashboard, checkpoint status, final submission.
- **Every member must register individually on the GDG portal BEFORE the event starts.** After it starts, only the team lead registers the team.
- **Final submission: 24 May, 14:30 sharp** — the dashboard locks at the deadline. Two links required: a **Google Slides** deck (official template, shared "Anyone with the link – Viewer") + a **public GitHub repo** with a clear README.
- **Presentation: 6 minutes** — 4 min pitch + demo, 1 min judge Q&A, 1 min scoring. A working demo beats long slides.

## 3. The three checkpoints

Organizers verify these in person — they are not self-submitted. The required number of us must be at our table, on time.

| Checkpoint                        | When               | What organizers check                                                                                                |
|-----------------------------------|--------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>CP1 — Team &amp; Idea Lock</b> | Day 1, 13:30–14:15 | Team present, 3–5 members, everyone GDG-registered, track chosen, one EdTech idea, project started at the hackathon. |
| <b>CP2 — MVP Plan &amp; AI</b>    | Day 1, 17:30–18:15 | A demoable MVP, the core AI feature, models/APIs used, repository status, realistic scope, current blockers.         |
| <b>CP3 — Demo Readiness</b>       | Day 2, 11:30–12:15 | Demo flow, Google Slides prepared, repo + README ready, AI feature status, submission risks.                         |

Minimum presence: a 3-member team needs 2 present; a 4–5-member team needs 3. Missing checkpoints can disqualify us — treat these windows as fixed.

## 4. Roles — who does what

| Person | Role & responsibility |
|--------|-----------------------|
|--------|-----------------------|

|                                                            |                                                                                                                                                             |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Amirsaid</b> — Team Lead                                | Owens registration, the team dashboard, checkpoint coordination, and <b>the pitch</b> (the 4-minute presentation). Single point of contact with organizers. |
| <b>Murodjon</b> — Lead Developer                           | Builds the product — the app, the AI integration, the working demo. Uses AI dev tools (disclosed in the README, as the rules require).                      |
| <b>Research &amp; Operations</b><br>(the rest of the team) | Problem & curriculum research, competitor evidence, Slides content, demo testing, and being present at every checkpoint.                                    |

**Everyone:** be at our table during the three checkpoint windows, and be reachable the whole event.

## 5. The two-day plan

| Window                 | Focus                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------|
| Day 1, morning         | Register the team on ai.gdgtashkent.uz; lock track (General Education) + the idea. → <b>CP1 (13:30)</b> |
| Day 1, afternoon       | Build the MVP demo path — the core lesson experience + the AI feature working. → <b>CP2 (17:30)</b>     |
| Day 1, evening / night | Deepen: more lesson content, the other surfaces, polish. Draft the Slides + README.                     |
| Day 2, morning         | Demo polish, finish the Slides + README, dry-run. → <b>CP3 (11:30)</b>                                  |
| Day 2, by 14:30        | <b>Final submission</b> (Slides + repo links). Then rehearse the 4-minute pitch until the slot.         |

## 6. How we win — the judging rubric (100 points)

| Criterion                   | Pts | Owned by                                            |
|-----------------------------|-----|-----------------------------------------------------|
| Technical Execution & Code  | 30  | Murodjon — working build, clean repo + README       |
| Innovation & Creativity     | 30  | Murodjon + team — original idea, real adaptive AI   |
| Problem–Solution Fit        | 20  | Research team — clear problem, right user, evidence |
| Presentation & Completeness | 20  | Amirsaid — demo quality, story                      |

Plus Ideathon loyalty points (up to +5) if our team continued the same idea, track, and majority of members from the Ideathon. Every role maps to points — no one is a passenger.

## 7. For first-time hackathoners — how to be useful

- A hackathon is a sprint: a real problem turned into a **working demo** in ~30 hours. A demo that works beats a beautiful slide that doesn't.
- If you're not writing code, your job is just as real: **become the expert on the problem** — why Uzbek students and parents need this, with concrete evidence — and turn that into the Slides and the pitch story.
- Be at the table during checkpoint windows. Be reachable. **Ask mentors questions** — that is allowed and smart.
- Small, steady help compounds: test the app, find one good statistic, prep one slide, catch one bug in the story. Don't disappear.

## 8. One honest rules note — read this

The rules say the project must "start at the hackathon" and that "pre-built full solutions are not allowed." We have early scaffolding and the design done as preparation. Two things keep us safe:

- **Before CP1, Amirsaid asks an organizer/mentor directly** what is acceptable, given we are continuing our Ideathon idea — get a clear answer in person.
- **Disclose everything** — every tool, library, template, AI agent, and all prior work — in the README and Slides. The rules require disclosure; judges review the repository and its history. Transparency protects us.

There is still a large amount to build live during the 34 hours — that is genuine hackathon work, done openly.

## 9. Before you arrive — checklist

---

- ☐ Registered individually on the GDG portal (do this **before** 23 May)
- ☐ Laptop + charger; a power strip if you have one
- ☐ GitHub account + Google account ready and logged in
- ☐ Know our track: **General Education**
- ☐ Arrive in time for **CP1 — Day 1, 13:30**
